Expertise at your service

All-around services and solutions. A product selection and software development are the best proposal for specific applications.

In the automation and motion control industry since 1980, Servotecnica manufactures and proposes unique products based on cutting-edge technologies developed by leading global manufacturers.

The concernment of giving a wide range of products guarantees its presence in all sectors of the industry requiring high performances, skilled engineers, reducing machine developing time and offering a service support which grants a reliable partner for your applications.

Wide Range & Cost Effectiveness

A wide range of Micromotors supported by a 35+ years experience will translate into a proficient product selection and design, reducing time-to-market and increasing your competitiveness.

Custom

Thanks to our lean and flexible production, we can deliver specifically designed samples in accordance to the requirements of any of your applications in a very short time, thus to provide you with the best solution.

Industries

SVTN A 01

Coreless BLDC motors

2 Pole Brushless DC Motors

Cost effective

High power density

High efficiency

The benefits of this new technology are torque and high-speed when compared to same sizing. The lack of cogging, a reduced ripple torque, a linear correlation between speed and torque, low inertia bring performance to greater level in terms of power, dynamics by means of reduced weights and reduced dimensions.

Servotecnica's brushless motors apply hall sensors as a standard option, in addition to having the magnetic encoder option. Thanks to the sensors it is possible to control rotation speed, and, thanks to the lack of cogging, provide high performance and accuracy.

Benefits

High power density	Long operational lifetime
High efficiency	No cogging
High reliability	Low inertia
Low noise	Robust
Low inductance	Cost-effective
Good heat dissipation

Explanation of the performance diagram

The performance diagram shows the range of possible operating points of a drive at an ambient temperature of 25°C and includes both the operation in the thermally insulated and in the cooled state. The possible speed ranges are shown in dependence on the shaft torque.

The sector shown dashed describes potential operating points in which the drive can be engaged in intermittent operation or with increased cooling.

Nominal torque [mNm]

Describes the max. continuous torque in the steady state at nominal voltage and with a thermal reduction of the R_{th2} value by 50 %. The continuous speed decreases linearly vis-a-vis the continuous torque. In the case of slotted flat brushless motors, this point is indicated with the motor mounted on a metal flange and is the same as MN. The continuous torque is independent of the continuous output power and can be exceeded if the motor is operated intermittently, for example, in S2 operation and/or if more cooling is applied.

Nominal output power [W]

Describes the max. possible output power in continuous operation in steady state with a thermal reduction of the R_{th2} value by 50 %. The value is independent of the continuous torque, responds linearly to the cooling factor and can be exceeded if the motor is operated intermittently, for example, in S2 operation and/or if more cooling is applied.

Nominal voltage curve [V]

The nominal voltage curve describes the operating points at U_N in the uncooled and cooled state. In steady state, the starting point corresponds to the no-load speed n_0 the drive. Operating points above this curve can be attained by an increase, operating points below by a reduction of the nominal voltage.

Additional Information for Slotted Brushless Motors The performance curves for slotted motors with a housing will be significantly different than the diagrams of the motors without housing. Typically motors without a housing will have a higher performance due to the effects of ambient air flow cooling.

*The diagram based on ambient temperature of 25°.

Example: Power diagram for rated values at continuous operation.

Table explanation

1 Nominal voltage

It is the applied voltage between two powered phases in block commutation. All nominal data (lines 2 – 9) refer to this voltage. Lower and higher voltages are permissible, provided that limits are not exceeded.

2 No load speed

It is the speed at which the unloaded motor runs with the nominal voltage applied. It is proportional to the applied voltage.

3 No load current

This is the typical current that the unloaded motor draws when operating at nominal voltage. No load friction depends heavily on temperature. It decreases in extended operation and increases at lower temperatures.

4 Nominal speed

It is the speed set for operation at nominal voltage and nominal torque at a motor temperature of 25°C.

5 Nominal torque

It is the torque generated for operation at nominal voltage and nominal current at a motor temperature of 25°C. It is at the limit of the motor's continuous operation range. Higher torques heat up the winding too much.

6 Nominal current

It is the current in the active phase the nominal torque at the given nominal speed (= max. permissible continuous load current). The maximum winding temperature is reached at 25°C ambient temperature in continuous operation with Nominal current.

7 Stall torque

It is the linearly calculated load torque for motors that causes the shaft to stall at nominal voltage. This torque often cannot be achieved due to saturation effects.

8 Stall current

It is the quotient from nominal voltage and the motor's terminal resistance. Stall current is equivalent to stall torque. With larger motors, Stall current cannot be reached due to the amplifier's current limits.

9 Max. efficiency

It is the optimal relationship between input and output power at nominal voltage. Contact factory for more detail.

10 Terminal resistance

It is determined by the resistance at 25 °C between two motor phase.

11 Terminal inductance

It is the winding inductance between two motor phase.

12 Torque constant

Represents the quotient from generated torque and applicable current.

13 Speed constant

It indicates the theoretical no load speed per volt of applied voltage, disregarding friction losses.

14 Speed/torque gradient

The speed/torque gradient is an indicator of the motor's performance. It is based on the quotient of ideal no load speed and ideal stall torque (tolerance $\pm 20\%$).

15 Mechanical time constant

It is the time required for the rotor to accelerate from standstill to 63% of its no load speed.

16 Rotor inertia

It is the mass moment of inertia of the rotor.

17 Thermal resistance housing-ambient

Characteristic values of thermal contact resistance without additional heat sinking. Lines 17 and 18 combined define the maximum heating at a given power loss (load). Thermal resistance Rth2 on motors with metal flanges can decrease by up to 80% if the motor is coupled directly to a good heat-conducting.

18 Thermal resistance winding-housing

Characteristic values of thermal contact resistance without additional heat sinking. Lines 17 and 18 combined define the maximum heating at a given power loss (load). Thermal resistance Rth2 on motors with metal flanges can decrease by up to 80% if the motor is coupled directly to a good heat-conducting.

19 Thermal time constant winding

These are the typical reaction times for a temperature change of winding and motor. It can be seen that the motor reacts much more sluggishly in thermal terms than the winding. The values are calculated from the product of thermal capacity and given heat resistances.

20 Thermal time constant motor

These are the typical reaction times for a temperature change of winding and motor. It can be seen that the motor reacts much more sluggishly in thermal terms than the winding. The values are calculated from the product of thermal capacity and given heat resistances.

21 Ambient temperature

Operating temperature range. This derives from the heat reliability of the materials.

22 Max. permissible winding temperature

Maximum permissible winding temperature.

23 Max. permissible speed

It is the maximum recommended speed based on thermal and mechanical perspectives. A reduced service life can be expected at higher speeds.

24 Radial play

Radial play is the bearing's radial movement

25 Max. axial load (dynamics)

Dynamic: axial loading permissible in operation. If different values apply for traction and thrust, the smaller value is given.

26 Max force for press fits (static)

Maximum axial force applying to the shaft at standstill if the force is not input at the other shaft end. This is not possible for motors with only one shaft end.

27 Max. radial load

The value is given for a typical distance from the front flange. As the distance increases, this value decreases.

28 Number of pole pairs

Number of north poles of the permanent magnet. The phase streams and commutation signals pass through per revolution p cycles. Servo-controllers require the correct details of the number of pole pairs.

29 Number of phases

All motors have three phases.

*The diagram based on ambient temperature of 25°.

The graph plots Speed [rpm] on the y-axis (0 to 40,000) against Power [W] on the x-axis (0 to 100). Four curves represent different temperatures: 30°C, 33°C, 46°C, and 54°C. A solid black line represents the n-T Curve at Nominal Voltage. A dashed red line indicates the continuous operating range. The speed decreases as power increases and temperature rises.

Power [W]	Speed [rpm] (30°C)	Speed [rpm] (33°C)	Speed [rpm] (46°C)	Speed [rpm] (54°C)
0	30000	28000	25000	22000
25	28000	26000	23000	20000
50	26000	24000	21000	18000
75	24000	22000	19000	16000
100	22000	20000	17000	14000

Cost effective

Low noise

High speed

Typically employed in the medical field for surgical tools, these motors merge the SVTN A Series characteristics to a optimized project for high-speed functions.

Thanks to a precise balancing of the rotor and the use of special bearings, maximum stability and low noise are guaranteed.

*The diagram based on ambient temperature of 25°.

The graph plots Speed [rpm] on the y-axis (0 to 130,000) against Power [W] on the x-axis (0 to 130,000). It features four solid black curves representing different torque levels: 75, 100, 125, and 150. A red dashed line indicates the maximum permissible speed. A shaded orange region represents the continuous operating range, bounded by a solid black line at the top and a dashed red line at the bottom. The text 'n-T Curve at Nominal Voltage' is present in the bottom left corner of the graph area.

SVTN A 03

Coreless BLDC motors

2 Pole Brushless DC Motors with Integrated Electronics

Cost effective

Easy to use

Long service life

The benefits of this build technology join the simplicity of use of a brushed DC motor with the longevity of a brushless motor, maintaining cost-effectiveness and ease of integration.

The lack of cogging is typical of the coreless motors and guarantees a reduce ripple torque, a linear correlation between torque, speed and low inertia.

The miniaturization of the electronics allows to maintain the diameter of the motor unvaried with a slight increase in length.

Benefits

Long lifetime

High efficiency

Low noise

High reliability

No cogging

Low inertia

Cost-effective

High power density

Long service life

The specific design construction of a coreless DC motor provides several advantages over traditional, iron core, technology. A first added value it is given from rotor lower mass and inertia, so very rapid acceleration and deceleration rates are possible. Furthermore the lack of iron reduce "iron losses" to provide higher efficiencies (up to 90 percent) than traditional DC motors. Last, but not least, coreless design reduces winding inductance, so sparking between the brushes and commutator is reduced, increasing motor life and reducing electromagnetic interference (EMI).

Servotecnica's Coreless DC Motors are available on a wide range of sizes and high flexibility on mechanical custom requirements.

Benefits

High power density

Long operational lifetime

High efficiency

Cost-effective

High reliability

No cogging

Low inductance

Low inertia

Good heat dissipation

☆ Customizations

Features

Operating temperature	-30° +100° C
Connections	Terminals
Magnets	Neodymium
Construction technology	Coreless winding system
Estimated operating lifetime	Lifetime depends on motor working conditions. It can reach 10.000 work hours under optimal conditions (almost 100 hours under extreme conditions).

Customizations

Flange	Shape
Shaft	Length/Diameter/D-Cut/double shaft
Winding	Special

Explanation of the performance diagram

The characteristic curve is composed of the following 4 key parameters:

No-load speed: It refers to the speed measured at the output shaft end when the motor is not connected to any load under the rated voltage, and the unit is RPM (revolutions per minute).

No-load current: It refers to the input current measured at the two terminals of the motor when the motor is not connected to any load at the rated voltage, and the unit is A (ampere).

Stall torque: The maximum torque measured by the motor at rated voltage due to the load causing the motor to stop rotating, in g.cm(g.cm).

Stalled current: This refers to the current measured in A (ampere) when the motor is stopped at the rated voltage due to the load.

It is recommended that you do not perform a stall operation on the motor, as this operation may cause the motor to “demagnetize” or even cause damage.

In general, the performance curve of the motor takes the output torque as the abscissa, and the speed, current, efficiency, and output power as the ordinate. correspondingly called: speed curve, current curve, efficiency curve, output power curve.

Speed curve

Is connected to the no-load speed NO point and stall torque Ts pointCurve, which indicates the speed of the motor under different load conditions. It is known that it decreases linearly with the increase in load.

Current curve

It is the curve shows the connection between two end points, no-load current and stall current. It describes motor current in different loading situation. As per diagram, current increase linearly with increasing torque.

Output power curve

It describes motor output power.

Efficiency curve

It describes motor efficiency and can be calculated with the following formula: $\text{Eff}(\%) = (\text{output power} / (\text{voltage} \times \text{current})) \times 100\%$. In general, the maximum efficiency point occurs in the area between stall torque/7 and stall torque/3. To design a suitable motor, maximum efficiency and maximum output power do not occur at the same point.

Table explanation

1 Nominal voltage

It is the applied voltage between two powered phases in block commutation. All nominal data (lines 2 – 9) refer to this voltage. Lower and higher voltages are permissible, provided that limits are not exceeded.

2 No load speed

It is the speed at which the unloaded motor runs with the nominal voltage applied. It is proportional to the applied voltage.

3 No load current

This is the typical current that the unloaded motor draws when operating at nominal voltage. No load friction depends heavily on temperature. It decreases in extended operation and increases at lower temperatures.

4 Nominal speed

It is the speed set for operation at nominal voltage and nominal torque at a motor temperature of 25°C.

5 Nominal torque

It is the torque generated for operation at nominal voltage and nominal current at a motor temperature of 25°C. It is at the limit of the motor's continuous operation range. Higher torques heat up the winding too much.

6 Nominal current

It is the current in the active phase the nominal torque at the given nominal speed (= max. permissible continuous load current). The maximum winding temperature is reached at 25°C ambient temperature in continuous operation with Nominal current.

7 Stall torque

It is the linearly calculated load torque for motors that causes the shaft to stall at nominal voltage. This torque often cannot be achieved due to saturation effects.

8 Stall current

It is the quotient from nominal voltage and the motor's terminal resistance. Stall current is equivalent to stall torque. With larger motors, Stall current cannot be reached due to the amplifier's current limits.

9 Max. efficiency

It is the optimal relationship between input and output power at nominal voltage. Contact factory for more detail.

10 Terminal resistance

It is determined by the resistance at 25 °C between two motor phase.

11 Terminal inductance

It is the winding inductance between two motor phase.

12 Torque constant

Represents the quotient from generated torque and applicable current.

13 Speed constant

It indicates the theoretical no load speed per volt of applied voltage, disregarding friction losses.

14 Speed/torque gradient

The speed/torque gradient is an indicator of the motor's performance. It is based on the quotient of ideal no load speed and ideal stall torque (tolerance $\pm 20\%$).

15 Mechanical time constant

It is the time required for the rotor to accelerate from standstill to 63% of its no load speed.

16 Rotor inertia

It is the mass moment of inertia of the rotor.

17 Thermal resistance housing-ambient

Characteristic values of thermal contact resistance without additional heat sinking. Lines 17 and 18 combined define the maximum heating at a given power loss (load). Thermal resistance Rth2 on motors with metal flanges can decrease by up to 80% if the motor is coupled directly to a good heat-conducting.

18 Thermal resistance winding-housing

Characteristic values of thermal contact resistance without additional heat sinking. Lines 17 and 18 combined define the maximum heating at a given power loss (load). Thermal resistance Rth2 on motors with metal flanges can decrease by up to 80% if the motor is coupled directly to a good heat-conducting.

19 Thermal time constant winding

These are the typical reaction times for a temperature change of winding and motor. It can be seen that the motor reacts much more sluggishly in thermal terms than the winding. The values are calculated from the product of thermal capacity and given heat resistances.

20 Thermal time constant motor

These are the typical reaction times for a temperature change of winding and motor. It can be seen that the motor reacts much more sluggishly in thermal terms than the winding. The values are calculated from the product of thermal capacity and given heat resistances.

21 Ambient temperature

Operating temperature range. This derives from the heat reliability of the materials.

22 Max. permissible winding temperature

Maximum permissible winding temperature.

23 Max. permissible speed

It is the maximum recommended speed based on thermal and mechanical perspectives. A reduced service life can be expected at higher speeds.

24 Max. axial load (dynamics)

Dynamic: axial loading permissible in operation. If different values apply for traction and thrust, the smaller value is given.

25 Max force for press fits (static)

Maximum axial force applying to the shaft at standstill if the force is not input at the other shaft end. This is not possible for motors with only one shaft end.

26 Max. radial load

The value is given for a typical distance from the front flange. As the distance increases, this value decreases.

27 Number of poles

Number of north poles of the permanent magnet. The phase streams and commutation signals pass through per revolution p cycles. Servo-controllers require the correct details of the number of pole pairs.

BRUSHLESS

FLAT Series SVTM F

Outrunner Brushless DC Motors

Customizable

Compact

High torque

The natural geometry of the outrunner Brushless Flat Motors, as well as the iron core winding, are the perfect fit for applications requiring high-torque in reduced dimensions.

Simplified design, high-end material selection, and automated manufacturing make the Flat Motors a high-performance solution at a competitive price.

Our vocation in listening to the client's requirements has led us to develop a customization-minded offer, focusing on specific application requirements such as integrated feedbacks, special cables and the geometry of shafts and flanges.

Benefits

High power density

High torque

High efficiency

Table explanation

1 Nominal voltage

It is the applied voltage between two powered phases in block commutation. All nominal data (lines 2 – 9) refer to this voltage. Lower and higher voltages are permissible, provided that limits are not exceeded.

2 No load speed

It is the speed at which the unloaded motor runs with the nominal voltage applied. It is proportional to the applied voltage.

3 No load current

This is the typical current that the unloaded motor draws when operating at nominal voltage. No load friction depends heavily on temperature. It decreases in extended operation and increases at lower temperatures.

4 Nominal speed

It is the speed set for operation at nominal voltage and nominal torque at a motor temperature of 25°C.

5 Nominal torque

It is the torque generated for operation at nominal voltage and nominal current at a motor temperature of 25°C. It is at the limit of the motor's continuous operation range. Higher torques heat up the winding too much.

6 Nominal current

It is the current in the active phase the nominal torque at the given nominal speed (= max. permissible continuous load current). The maximum winding temperature is reached at 25°C ambient temperature in continuous operation with Nominal current.

6 Peak torque

7 Peak current

Stall torque is the linearly calculated load torque for motors that causes the shaft to stall at nominal voltage. This torque often cannot be achieved due to saturation effects. Stall current is the quotient from nominal voltage and the motor's terminal resistance. Stall current is equivalent to stall torque. With larger motors, Stall current cannot be reached due to the amplifier's current limits.

8 Line to line resistance

It is determined by the resistance at 25 °C between two motor phase.

9 Line to line inductance

It is the winding inductance between two motor phase

10 Terminal inductance

It is the winding inductance between two motor phase.

11 Back EMF constant

It indicates the theoretical no load speed per volt of applied voltage, disregarding friction losses.

12 Speed constant

It indicates the theoretical no load speed per volt of applied voltage, disregarding friction losses.

13 Speed/torque gradient

The speed/torque gradient is an indicator of the motor's performance. It is based on the quotient of ideal no load speed and ideal stall torque (tolerance $\pm 20\%$).

14 Mechanical time constant

It is the time required for the rotor to accelerate from standstill to 63% of its no load speed.

15 Shaft radial play

Radial play is the bearing's radial movement.

16 Shaft axial play

Axial play is the bearing's radial movement. A spring is utilized to preload the motor's bearings.

17 Thermal resistance winding-housing

Characteristic values of thermal contact resistance without additional heat sinking. Lines 17 and 18 combined define the maximum heating at a given power loss (load). Thermal resistance R_{th2} on motors with metal flanges can decrease by up to 80% if the motor is coupled directly to a good heat-conducting.

18 Thermal time constant winding

These are the typical reaction times for a temperature change of winding and motor. It can be seen that the motor reacts much more sluggishly in thermal terms than the winding. The values are calculated from the product of thermal capacity and given heat resistances.

19 Operation ambient

Operating temperature range. This derives from the heat reliability of the materials.

20 Ambient temperature

Operating temperature range. This derives from the heat reliability of the materials.

21 Max. permissible winding temperature

Maximum permissible winding temperature.

22 Max. permissible speed

Is the maximum recommended speed based on thermal and mechanical perspectives. A reduced service life can be expected at higher speeds.

23 Radial play

Radial play is the bearing's radial movement

24 Max. axial load (dynamics)

Dynamic: axial loading permissible in operation. If different values apply for traction and thrust, the smaller value is given.

25 Max force for press fits (static)

Maximum axial force applying to the shaft at standstill if the force is not input at the other shaft end. This is not possible for motors with only one shaft end.

26 Max. radial load

The value is given for a typical distance from the front flange. As the distance increases, this value decreases.

27 Number of pole pairs

Number of north poles of the permanent magnet. The phase streams and commutation signals pass through per revolution p cycles. Servo-controllers require the correct details of the number of pole pairs.

28 Number of phases

All motors have three phases.

Planetary gearboxes

GEARBOXES

GEARBOXES

COSMOS SVTG

Planetary gearboxes

Cost effective

Robust

Compact

The planetary gearboxes are characterized by a robust design and are employed for uses where high-performance and reduce dimensions are required.

The gear trains can be made of steel or plastic polymers, also in blended configurations when needed.

The gearboxes are lubricated according to the needs with reference to temperature and functionality. They are available with sleeve, ball or customized bearings.

Available also in personalized options designed upon request.

Features

Gear materials	Metal / Polymer
Diameter	from 10mm to 42mm
Torque	from 0.2Nm to 45Nm
Operating temperature	-20° +100°C (special lubrication might be needed)
Estimated operating lifetime	Lifetime depends on gearbox working conditions. Operating life span can vary between 1.000 to 3.000 work hours.

Polymer (for quiet operation)

Table explanation

1 Housing material

2 Geartrain material

Geartrain could be in metal and polymer to increase torque performance and reduce noise.

3 Max input speed (continuous operation)

It is based on service life considerations. If this value is greatly exceeded, the service life can be shortened, the gear heats up more and more noise is generated.

4 Bearing on output shaft

It is possible to choose a ball bearing or sleeve bearing depending on the application, as standard from size 22 is available only for ball bearings.

5 Max radial load (dynamics)

The value is given for a typical distance from the front flange. As the distance increases, this value decreases.

6 Max. axial load

Dynamic: axial loading permissible in operation. If different values apply for traction and thrust, the smaller value is given.

7 Max shaft press fit force

Maximum axial force applying to the shaft at standstill if the force is not input at the other shaft end. This is not possible for motors with only one shaft end.

8 Radial play

The radial measurement is always carried out under a test force that is smaller than the maximum radial load.

9 Axial play

The value for the axial play of a gear is determined between the two axial end positions of the output shaft.

10 Temperature range

The temperature range is -20°C and +125°C, but may be extended for some gears. Special lubrication can be supplied on request, even for other temperature ranges.

11 Number of stages

It states the number of gear stages engaged in series.

12 Reduction ratio

The reduction indicates the ratio by which the speed of the gear output shaft is smaller than the motor speed.

13 Gear length L [mm]

L describes the gearbox length (adapter flange included).

14 Continuous torque [Nm]

The continuous torque provides the maximum load permanently delivered to the output shaft. It can be exceeded, but it affects the service life.

15 Intermittent torque [Nm]

The short-time torque is the maximum torque that may be output on the output shaft.

16 Efficiency [%]

The specified efficiency is a maximum value that is valid for maximum continuous torque. The efficiency is stage-dependent and is related to the output torque and operating temperature.

17 No load backlash [°]

Gear backlash is the turning angle of the gear output shaft when the input shaft is blocked.

18 Weight [g]

Table explanation

1 Housing material

2 Geartrain material

Geartrain could be in metal and polymer to increase torque performance and reduce noise.

3 Max input speed (continous operation)

It is based on service life considerations. If this value is greatly exceeded, the service life can be shortened, the gear heats up more and more noise is generated.

4 Bearing on output shaft

It is possible to choose a ball bearing or sleeve bearing depending on the application, as standard from size 22 is available only for ball bearings.

5 Max radial load (dynamics)

The value is given for a typical distance from the front flange. As the distance increases, this value decreases.

6 Max. axial load

Dynamic: axial loading permissible in operation. If different values apply for traction and thrust, the smaller value is given.

7 Max shaft press fit force

Maximum axial force applying to the shaft at standstill if the force is not input at the other shaft end. This is not possible for motors with only one shaft end.

8 Radial play

The radial measurement is always carried out under a test force that is smaller than the maximum radial load.

9 Axial play

The value for the axial play of a gear is determined between the two axial end positions of the output shaft.

10 Temperature range

The temperature range is -20°C and $+125^{\circ}\text{C}$, but may be extended for some gears. Special lubrication can be supplied on request, even for other temperature ranges.

11 Number of stages

It states the number of gear stages engaged in series.

12 Reduction ratio

The reduction indicates the ratio by which the speed of the gear output shaft is smaller than the motor speed.

13 Gear length L [mm]

L describes the gearbox length (adapter flange included).

14 Continuous torque [Nm]

The continuous torque provides the maximum load permanently delivered to the output shaft. It can be exceeded, but it affects the service life.

15 Intermittent torque [Nm]

The short-time torque is the maximum torque that may be output on the output shaft.

16 Efficiency [%]

The specified efficiency is a maximum value that is valid for maximum continuous torque. The efficiency is stage-dependent and is related to the output torque and operating temperature.

17 No load backlash [°]

Gear backlash is the turning angle of the gear output shaft when the input shaft is blocked.

18 Weight [g]

Encoders

Magnetic Incremental Encoders

Cost effective

Robust

Compact

Thanks to incremental magnetic encoders (single ended and line driver), you can obtain a reliable control of speed and position.

*As an option, incremental optic encoders are available for high resolution needs.

Features

Housing	Engineering plastic
Operating temperature	-40° +125° C
Signal	3 or 5 channels: ABI; A A/, B B/, I I/
Resolution	from 25 to 1024 ppr
Supply Voltage	5 VDC
Max speed	28.000 rpm

EN 16A,
EN 16ALEN 22A, EN 22AL
EN 22B, EN 22BLEN 24B,
EN 24BL

Electric Data	Unit	EN Series	EN ..L Series
1 Output signal		TTL single ended	TTL line driver
2 Number of channels	#	3	5
3 Supply voltage	VDC	5	5
4 Counts per revolution	ppr		up to 1024
5 Max. speed	rpm	28000	28000
6 Phase shift, Channel A to B	deg.		90
7 Index pulse width	deg.		90
8 Interia of code disc	g/cm ²		0,7
9 Operating temperature range	°C		-40..+125

Features & Configuration

- Magnetic rotary encoder chip.
- Output interface: ABI.
- Configuration programmable: Zero position, ABI line per revolution.
- ABI binary programmable decimal and binary pulse count: 1000, 500, 400, 300, 200, 100, 50, 25, 1024, 512, 256 ppr.

Output signal

Connection

Direction of rotation: CCW viewed from front shaft end

Connection	EN16; EN22A; EN22B; EN24	EN16L; EN22AL; EN22BL; EN24L	PVC

Connector: Standard DIN 41651 IDC, 8 pins, dual row 2.54x2.54mm.
Mating connector: Molex 7024-60801 or compatible

Servo Drives

DC and BLDC Motors

CANopen EtherCAT®

PROFINET®

Position Velocity Torque control

PLC

Extended temperature

In the industrial environment, high-performance drives must be used to ensure the electric motors' high performance and energy efficiency. Each drive controls motor operation according to specific control algorithms. Servotecnica offers servo drives with EtherCAT, Profinet, and CANopen protocols, supply voltages up to 60VDC.

Benefits

Programmable

Compact

Cost-effective

Features

Control mode	Position, velocity, torque
Fieldbus	CANopen, EtherCAT, Profinet
Supply Voltage	9..60 VDC
I/O	Analog and digital
Operating temperature	-40° +70° C

SVTE-A-□○○-[Fieldbus]

○ Model type

Notes

This image shows a single sheet of white paper with horizontal ruling lines. The lines are evenly spaced and run across the width of the page. There are no margins, text, or other markings on the paper.

Analog inputs	
21 Number	3 (Ain0..2)
22 Signal type - Ain0..1	+/- 10VDC, 12 Bit, differential, 200 kOhm input impedance
23 Signal type - Ain2	0..5 VDC, 12 Bit, single ended, 5VDC pull up intern 1,5 kOhm
Environment	
24 Operating temperature	°C -40...+70

Connection

X1 Supply		
1	FE	Functional earth
2	+Up	Power supply voltage
3	GND	Ground for power supply voltage
4	+Ue24V	Electronic supply voltage
5	GND	Ground for electronic supply voltage
X2 Analog Inputs		
1	+Ain0	Analog input 0, positive
2	-Ain0	Analog input 0, negative
3	+Ain1	Analog input 1, positive
4	-Ain1	Analog input 1, negative
5	Ain2	Analog Input 2 (5V)
X3 CAN bus		
1	CAN Hi	CAN High
2	CAN Lo	CAN Low
3	res.	Reserved
X4 Digital inputs/outputs		
1	res.	Reserved
2	Din0	Digital input 0
3	Din1	Digital input 1
4	Din2	Digital input 2
5	Din3	Digital input 3
6	Din4	Digital input 4
7	Din5	Digital input 5
8	Din6	Digital input 6
9	Din7	Digital input 7
10	Dout0	Digital output 0
11	Dout1	Digital output 1
12	Dout2	Digital output 2
13	Dout3	Digital output 3
X5 Hall and inc. encoder		
1	H1	Hall sensor 1
2	H2	Hall sensor 2
3	H3	Hall sensor 3
4	A	Inc. encoder, A channel
5	/A	Inc. encoder, A channel invert
6	B	Inc. encoder, B channel
7	/B	Inc. encoder, B channel inverted
8	Inx	Inc. encoder, index channel
9	+U5V	5V output voltage for sensor supply
10	GND	Ground for sensor supply (don't connect with system GND)
X6 Motor		
1	Ma	Motor phase A
2	Mb	Motor phase B
3	Mc	Motor phase C

SVTE-A-E55-EtherCAT Servo Drives

60VDC | 8A
DC motors, BLDC motors

CANopen | EtherCAT

Values	Unit
Power	
1 Electronic supply voltage U _e	VDC 9..30
2 Power supply voltage U _p	VDC 9..60
3 Max. output current	A 50
4 Continuous output current	A 8
5 Output voltage	Up to 100%
Motor types	
6 DC motors	yes
7 BLDC motors	yes
8 Stepper motors	no
Mechanical	
9 Size LxWxH	mm 78x74x47
CAN bus	
10 Protocol	DS301
11 Device profile	DS402
12 Galvanically isolated	no
EtherCAT	
13 Type	EtherCAT Slave
14 Physical layer	100 Base-Tx EtherCAT
15 Max. baudrate	100 Mbit/s
16 Number of ports	2xRJ45 (In,Out)
17 Protocol	CoE (CANopen over EtherCAT)
Incremental encoder	
18 Input voltage (24VDC tolerant)	0..5
19 Signal type	differential, open collector, single ended
Hall sensors	
20 Input voltage	0..5
21 Signal type	open collector, single ended
Digital input	
22 Number	8 (Din0..7)
Digital output	
23 Number	4 (Dout0..3)
24 Continuous output current	A 0.3 (Load: resistive, inductive)
Analog inputs	
25 Number	3 (Ain0..2)
26 Signal type - Ain0..1	+/- 10 VDC, 12 Bit, differential
27 Signal type - Ain2	0..5VDC, 12 Bit, single ended
Environment	
28 Operating temperature	°C -40...+70

Connection
